

This new station carries out Mr. Ball's prediction and extends the range of the species in the Rocky Mountains about 500 miles southward of the previously recorded stations in Montana.—FRANCIS WELLES HUNNEWELL, Wellesley, Massachusetts.

---

LEPACHYS COLUMNARIS IN EASTERN MASSACHUSETTS.—Last July, a plant was found near the railroad station at South Billerica and was brought to me for name. It was a very poor specimen, but appeared to be *Lepachys columnaris*, Torr. & Gray. The Gray Herbarium has since confirmed my opinion and stated that no specimen of this species had been received from this region and that one would be welcome. This I was unable to get, as there was but one plant and the root had been transplanted to a garden. It was thought that the seed might have been brought in baled hay which was unloaded at the station.—CHARLES W. JENKS, Bedford, Massachusetts.
